Today's Hottest Thing

Fuel
Fuel is any kind of combustible material. Wood is the most common combustible used. Below are the types of wood you require for a successful fire.

- Kindling: Sticks as thick as fingers
- Firewood: Logs of wood to keep a fire burning long into the night

Heat
A fire is ignited by a heat source—like friction or a spark.

Oxygen
Fire requires air to burn.

Tinder
Small twigs, dry leaves, needles, bark, wood shavings or paper if you have it: should burn immediately when lit.

Choose a site
- Pick a site close to a water source.
- Choose a site with a natural windbreak.
- Build your fire in the provided fire pit or on a durable surface like a rock, dirt or sand to prevent scorching.
- Keep gathered firewood away from the fire area.

Building your campfire
- Keep your fire small—no bigger than one metre high and one metre wide.
- Small fires are safer, easier to control and easier to put out.
- Small fires are ideal for cooking.

Around the campfire
- Flames should be the only thing dancing near the fire pit.
- When performing a skit or active song, you should do so away from the fire.
- Keep fire in the pit. Do not wave flaming sticks.
- Do not get too close to the fire when cooking with a stick. Your stick should be long enough for you to cook without feeling strong heat from the flames.

Stay close
- Collect plenty of firewood before lighting the fire, so that it does not have to be left unattended to gather more fuel.
- If you start a campfire, you are responsible to tend it, ensuring it is kept under control and putting it out.

Put the fire out

1. Pour lots of water on the campfire.
2. Stir the ashes with a stick.
3. Pour more water over top of it.

Repeat these three steps until:
1) The ashes don’t hiss.
2) Everything looks wet.
3) No more smoke comes from the ashes.

For a fire to burn properly you need fuel, heat and air.
